Human Energy Economics (HEE)

A Theory of Organizational Capacity and Sustainable Execution

Md. Mozammel Hoque
Independent Management Researcher
Originator of Human Energy Economics (HEE)

Version: 1.0 — Canonical Edition
Date: 1 September 2026

The HEE Identity

Element	HEE Definition
One Economic Lens	**Human Energy Economics (HEE)**
Two Economic Assets	**Organizational Capacity · Human Energy**
Six Execution Factors	**Demand · Human Energy · Capability · Connection · Decision Quality · Enablement**
Five Diagnostic Conditions	**Depletion · Deficiency · Disconnection · Constraint · Conversion Failure**
Five Diagnostic Responses	**Recover · Develop · Connect · Enable · Investigate**
One Governing Question	**What prevents the organization from turning its capacity and Human Energy into sustainable results?**
One Diagnostic Question	**What limits application?**
One Value Objective	**Increase valuable application and sustained execution without unnecessarily degrading future capacity.**
One Cross-Cutting Principle	**Protect**

Core Principles

HEE treats organizational drain as an economic problem—not an employee problem.

Organizational Capacity is an organization-level economic asset.

Human Energy is a distinct human-level economic asset that contributes to usable organizational capacity without being reducible to Organizational Capacity.

Capability is potential.

Capacity is the ability to mobilize and apply that potential.

Effective Application is capability and capacity brought into purposeful action.

Execution converts application into intended results.

Sustainable execution requires preserving and renewing the capacity required for subsequent execution.

> **HEE therefore treats Human Energy and Organizational Capacity as economic assets—not infinite resources.**

Foundational Distinction

Consumption ≠ Drain ≠ Deficiency ≠ Disconnection ≠ Constraint

Work necessarily consumes Human Energy and Organizational Capacity.

Consumption is not inherently drain.

The economic question is whether resources consumed in execution produce sufficient present value or legitimate future value while preserving the capacity required for subsequent execution.

Concept	HEE Meaning
Consumption	Necessary or legitimate use of capacity in performing work
Drain	Unnecessary depletion, impairment, diversion, or loss of capacity relative to value created or legitimately expected
Deficiency	Required capacity or capability is genuinely missing or insufficient
Disconnection	Existing capability cannot work together effectively
Constraint	Existing capacity or capability cannot be effectively mobilized or applied because of organizational conditions
Conversion Failure	Sufficiently available, connected, and enabled capacity still fails to become intended action

These conditions may coexist and interact.

The appropriate response depends on the condition—not merely the symptom.

Capability, Capacity, Application, and Execution

This is the foundational HEE distinction.

Concept	Meaning	Core Question
Capability	Potential to perform	**What could we do?**
Capacity	Ability to mobilize and apply potential under actual conditions	**What can we bring into action?**
Effective Application	Purposeful realization of available capacity and capability	**What are we actually applying?**
Execution	Application realized into intended action and results	**What are we accomplishing?**
Sustained Execution	Results produced repeatedly without unnecessarily degrading future capacity	**Can we do it again?**

The Core Distinction

Capability = Potential.

Capacity = Ability to mobilize and apply potential.

Application = Potential brought into purposeful action.

Execution = Application producing intended results.

Knowledge and Application

Knowledge alone is potential.

Applied knowledge is power.

Knowledge may contribute to capability, but capability becomes economically useful only when it can be mobilized and applied effectively.

From Capacity to Value

```
ORGANIZATIONAL CAPACITY + HUMAN ENERGY
                ↓
       USABLE CAPACITY + CAPABILITY
                ↓
   DIAGNOSE WHAT LIMITS APPLICATION
                ↓
 RECOVER / DEVELOP / CONNECT / ENABLE / INVESTIGATE
                ↓
        EFFECTIVE APPLICATION
                ↓
             EXECUTION
                ↓
       SUSTAINED EXECUTION
                ↓
   SUSTAINABLE EXECUTION CAPACITY
                ↓
      SUSTAINABLE BUSINESS VALUE
                ↺
        RENEW / REINVEST
```

> **Extraction depletes. Cultivation compounds.**

The HEE Promise

Better execution today. Stronger capacity tomorrow.

HEE does not seek merely to increase current output.

It seeks to:

> **Increase valuable application and sustained execution without unnecessarily degrading the capacity required for future execution.**

---

1. The Problem HEE Sees

Organizations may possess capable people, advanced technology, sophisticated processes, substantial resources, and significant expertise, yet execution can still fall short of potential.

Growth often increases:

- decisions;
- dependencies;
- interfaces;
- handoffs;
- coordination requirements;
- information requirements; and
- competing priorities.

An organization may therefore not have become less capable.

> **It may have become more interconnected without becoming better connected.**

Capability alone is insufficient.

For capability to become sustained execution, it must be **available, connected, appropriately directed, enabled, and effectively applied**.

---

2. A Possible Organizational Pathway

HEE proposes one possible pathway through which organizational conditions may become business consequences:

```
ORGANIZATIONAL FRAGMENTATION
             ↓
OPERATIONAL NOISE + DISCONNECTED CAPABILITY
             ↓
CAPACITY LOSS + APPLICATION CONSTRAINTS
             ↓
ORGANIZATIONAL DRAIN
             ↓
EXECUTION DEGRADATION
             ↓
CUSTOMER FRICTION
             ↓
VALUE LOSS
```

This is a **diagnostic narrative, not a universal causal law**.

The relationships require empirical testing.

---

3. Why Existing Approaches May Be Insufficient

Existing management disciplines address important organizational problems, but often examine different parts of the system.

Approach	Potential Limitation
Employee Wellness	May address symptoms without examining organizational conditions
Productivity Optimization	May optimize work before examining capacity availability
Strategy	Establishes direction but does not guarantee execution
Process Improvement	Improves flow but may overlook Human Energy and broader capacity
Talent Management	Develops capability but does not guarantee application
Employee Engagement	Addresses motivation but does not by itself establish sustainable capacity

HEE does not reject these approaches.

It asks the integrating question:

> **How do Human Energy and Organizational Capacity become effective application, sustained execution, and sustainable business value?**

---

4. The Governing Question

> **What prevents the organization from turning its capacity and Human Energy into sustainable results?**

Central Diagnostic Question

> **What limits application?**

HEE focuses on the conditions between **available potential and effective application**.

---

5. HEE Diagnostic Architecture

HEE diagnoses what limits application through five conditions.

These are **diagnostic conditions—not sequential stages**.

Diagnostic Condition	Core Question	Response
Depletion	What capacity is being unnecessarily consumed, depleted, or degraded?	**Recover**
Deficiency	What required capacity or capability is genuinely insufficient?	**Develop**
Disconnection	What existing capability cannot combine effectively?	**Connect**
Constraint	What organizational condition prevents available capacity and capability from being mobilized and effectively applied?	**Enable**
Conversion Failure	Why does sufficiently available, connected, and enabled capacity still fail to become intended action?	**Investigate**

Critical Diagnostic Rule

Do not automatically fix the largest gap. Fix the condition that most limits sustainable execution.

---

6. Diagnostic Decision Sequence

```
WHAT LIMITS APPLICATION?
          ↓
      CONSUMED?
          → RECOVER

        MISSING?
          → DEVELOP

    DISCONNECTED?
          → CONNECT

     CONSTRAINED?
          → ENABLE

FAILING TO CONVERT?
          → INVESTIGATE
          ↓
   EFFECTIVE APPLICATION
```

Conversion Failure is deliberately residual.

It applies when depletion, deficiency, disconnection, and constraint have been reasonably examined or excluded.

7. Organizational Drain

> **Organizational Drain is the economic condition in which organizational capacity is consumed, depleted, impaired, diverted, or lost without sufficient productive contribution, necessary protection, capability development, or legitimate expected future value.**

Drain may arise through:

- unnecessary demand;
- operational noise;
- repeated work;
- coordination friction;
- poor configuration;
- capability disconnection;
- organizational constraints; or
- ineffective application.

Concept	Meaning
Operational Noise	Unnecessary activity, interference, or friction consuming capacity without proportional productive contribution
Capacity Loss	Reduction in available capacity
Capacity Impairment	Reduction in effectiveness, accessibility, reliability, or quality
Capacity Allocation	Distribution of capacity across competing priorities
Capacity Configuration	Structural arrangement of capabilities, dependencies, interfaces, decision rights, and resources

Operational noise can be a source, mechanism, or manifestation of organizational drain.

---

8. Human Energy in HEE

> **Human Energy is the cognitive, emotional, and physical capacity people bring to work and require to apply capability and participate effectively in organizational execution.**

HEE treats Human Energy as:

- a distinct human-level economic asset;
- a contributor to usable organizational capacity;
- a condition influencing capability application;

- something that can be depleted or protected; and
- something that can be recovered, developed, connected, enabled, applied, and renewed.

Human Energy is not the whole of Organizational Capacity.

---

9. The Human Energy Economic Question

The question is not whether work consumes Human Energy.

Work necessarily consumes energy.

The question is:

> **Does the energy consumed produce sufficient present value or legitimate future value without unnecessarily degrading the capacity required for subsequent execution?**

Organizational Drain is the economic counterpart to unnecessary Human Energy depletion and broader capacity loss.

---

10. Burnout-Related Capacity Depletion as a Signal

HEE treats burnout-related capacity depletion as a **possible signal warranting investigation**, not as proof of organizational failure or individual weakness.

HEE does not claim that all burnout is organizationally caused.

```
BURNOUT SIGNAL
      ↓
POSSIBLE HUMAN ENERGY DEPLETION
      ↓
INVESTIGATE CONTRIBUTING CONDITIONS
      ↓
DEMAND / NOISE / DISCONNECTION / CONSTRAINT / DEFICIENCY
      ↓
SYSTEM DIAGNOSIS
      ↓
APPROPRIATE INTERVENTION
```

---

11. Core HEE Concepts

Concept	HEE Definition
Organizational Capacity	Organization-level economic asset representing potential and means to mobilize and sustain action
Human Energy	Human-level economic asset representing cognitive, emotional, and physical capacity brought to work
Usable Capacity	Capacity that can actually be mobilized under real organizational conditions
Capability	Potential to perform
Capacity	Ability to mobilize and apply potential
Effective Application	Purposeful realization of available capacity and capability
Execution	Application converted into intended action and results
Sustainable Execution Capacity	Capacity preserved and strengthened so execution can be repeated
Sustainable Business Value	Enduring value created through sustained execution

12. Execution Factors

These six factors represent the principal conditions through which organizational and human capacity become—or fail to become—effective application.

Execution Factor	Function
Demand	Determines the amount and intensity of capacity required
Human Energy	Conditions available human capacity to act
Capability	Represents potential to perform
Connection	Determines whether distributed capabilities can work together
Decision Quality	Determines whether action can be appropriately directed
Enablement	Determines whether organizational conditions permit action

Execution factors are not diagnoses in themselves.

The diagnostic architecture identifies **what is limiting their effective contribution**.

13. Demand

Demand is the volume, intensity, complexity, and interruption burden placed on organizational and human capacity by required and discretionary work.

Demand determines how much capacity is required for a given level of activity.

Necessary demand may consume capacity productively.

Unnecessary or disproportionate demand may contribute to drain.

---

14. Decision Quality

Decision Quality is the degree to which decisions are timely, sufficiently informed, appropriately authorized, and fit for the circumstances in which they must be executed.

Poor decision quality may arise from:

- capability deficiency;
- disconnection;
- enablement constraints;
- information limitations;
- demand pressure; or
- other organizational conditions.

HEE therefore diagnoses the underlying condition rather than treating decision quality as a standalone root cause.

---

15. Asset → Value Logic

```
ORGANIZATIONAL CAPACITY + HUMAN ENERGY
                ↓
            CAPABILITY
                ↓
          USABLE CAPACITY
                ↓
   DIAGNOSE WHAT LIMITS APPLICATION
                ↓
 RECOVER / DEVELOP / CONNECT / ENABLE / INVESTIGATE
                ↓
```

```
        EFFECTIVE APPLICATION
                  ↓
             EXECUTION
                  ↓
       SUSTAINED EXECUTION
                  ↓
   SUSTAINABLE EXECUTION CAPACITY
                  ↓
      SUSTAINABLE BUSINESS VALUE
                  ↺
        RENEW / REINVEST
```

This is the central **asset-to-value logic** of HEE.

---

16. HEE Management Logic

HEE management is an integrated operating cycle rather than a rigid linear sequence.

Protection as a Cross-Cutting Principle

Protect is preventive.

It is not a sixth diagnostic condition.

Management Move	Purpose
Protect	Prevent unnecessary degradation
Diagnose	Identify what limits application
Recover	Restore depleted capacity
Develop	Strengthen capability and capacity
Connect	Integrate distributed capability
Enable	Change conditions so capable people can act
Apply	Convert capacity and capability into action
Execute	Deliver intended results
Learn / Adapt	Improve through evidence and experience
Renew	Restore and strengthen future capacity

Management Cycle

```
PROTECT
   ↓
DIAGNOSE
   ↓
RECOVER / DEVELOP / CONNECT / ENABLE / INVESTIGATE
   ↓
APPLY
   ↓
EXECUTE
   ↓
LEARN
   ↓
ADAPT
   ↓
RENEW
   ↺
```

---

17. Implementation Path

The implementation path translates HEE into practical management activity.

```
FRAME
  ↓
AUDIT
  ↓
DIAGNOSE
  ↓
IDENTIFY LIMITING CONDITION
  ↓
PRIORITIZE
  ↓
INTERVENE
  ↓
APPLY
  ↓
EXECUTE
  ↓
LEARN
  ↓
ADAPT
```

```
   ↓
RENEW
```

The intervention may involve:

RECOVER · DEVELOP · CONNECT · ENABLE · INVESTIGATE

The sequence may be revisited as conditions change.

---

18. Prioritization

HEE proposes the following conceptual prioritization heuristic:

> **Priority = Urgency × Dependency × Value Impact**

This is a **heuristic, not a validated mathematical formula**.

Practical Rule

Fix the condition that most prevents the system from moving forward.

Acute depletion may require recovery first.

Immediate execution failure may require stabilization.

The appropriate response depends on the **limiting condition**, not simply its size.

---

19. Human Energy Management System (HEMS)

HEMS is the Human Energy management subsystem within the broader HEE operating architecture.

Component	Primary Role
HEA — Human Energy Audit	Measure and diagnose
HERF — Human Energy Recovery Framework	Recover Human Energy
HEDP — Human Energy Development Plan	Develop Human Energy and capability
Capability Interconnection	Connect distributed capability
HEEn — Human Energy Enablement	Enable effective application

Component	Primary Role
EES — Execution Excellence System	Execute, monitor, control, and adapt

---

20. OSF + 5R Cascade

The **Operational Silence Framework (OSF)** reduces unnecessary operational noise.

The **5R Cascade** provides a decision sequence:

REMOVE → REDUCE → REPLACE → RE-ENGINEER → RETAIN

Step	Question
Remove	Is it necessary at all?
Reduce	Can we do less of it?
Replace	Can a better alternative perform the same purpose?
Re-engineer	Can it be redesigned, simplified, integrated, standardized, or automated?
Retain	If necessary, keep it effective and monitor it

Remove before you optimize.

---

21. Capability Architecture and Connection

```
INDIVIDUAL CAPABILITY
        ↓
TEAM CAPABILITY
        ↓
FUNCTIONAL CAPABILITY
        ↓
ORGANIZATIONAL CAPABILITY
```

Capability at one level does not automatically become effective organizational capability at the next.

Value often depends on capabilities working across:

- functions;
- systems;
- processes;

- interfaces; and
- handoffs.

Key Question

> **Where does value require capabilities to work together—and what prevents that connection?**

---

22. Organizational Enablement

Organizational Enablement addresses the conditions that determine whether capable people and capabilities can actually act.

Dimension	What It Enables
Resource	People, tools, budget, materials, information
Structural	Roles, workflows, interfaces, reporting
Cultural	Norms and behaviors supporting action
Decision	Authority, accountability, decision rights
Support	Leadership, coaching, administrative support
Environmental	Physical and digital working conditions

Key Question

> **What organizational condition must change so capable people can act effectively?**

---

23. Technology & AI

Technology can accelerate execution, but it does not eliminate the Human Energy requirement.

Automation may reduce demand while increasing complexity, oversight, connection, or capability requirements.

Technology Effect	HEE Implication
Reduces unnecessary demand	Redirect released capacity toward higher-value work
Increases complexity	Strengthen connection and enablement
Requires new capability	Develop capability

Technology Effect	HEE Implication
Creates connection demands	Strengthen Capability Interconnection
Creates enablement demands	Strengthen HEEn
Increases judgment requirements	Protect Human Energy and decision capability

HEE Technology Question

> **Does technology increase Sustainable Execution Capacity—or simply increase the speed of complexity?**

---

24. EX and CX as Synchronized System Signals

HEE treats **Employee Experience (EX)** and **Customer Experience (CX)** as concurrent downstream signals of upstream organizational conditions.

```
ORGANIZATIONAL CONDITIONS
Capacity · Capability · Constraints · Noise
              ↓
        EX + CX SIGNALS
              ↓
       SYSTEM FEEDBACK
              ↓
          DIAGNOSIS
              ↓
 RECOVER / DEVELOP / CONNECT / ENABLE / INVESTIGATE
              ↺
```

The Mirror Effect

Internal employee strain may mirror external customer friction.

When organizations experience disconnection or constraint, employees may encounter:

- coordination drag;
- administrative burden;
- cognitive overload;
- unnecessary friction.

Customers may concurrently encounter:

- delays;

- poor responsiveness;
- inconsistency;
- service friction;
- reduced value delivery.

> **HEE does not assume EX causes CX or CX causes EX. Both are downstream signals of upstream organizational conditions.**

Inside-Out: EX

EX can reveal internal conditions affecting Human Energy, capability mobilization, decision-making, coordination, and enablement.

Outside-In: CX

CX can reveal externally visible consequences of disconnected capability, slow decisions, operational bottlenecks, and ineffective application.

Key Takeaway

> **EX and CX are complementary diagnostic lenses—not standalone explanations of causation.**

---

25. Why HEE Matters to Customers

Customer experience is influenced by how organizational and human capacity are configured, connected, enabled, and applied.

When internal capacity is drained, fragmented, or constrained, customers may experience:

- delays;
- inconsistency;
- friction;
- reduced responsiveness; or
- reduced service quality.

HEE therefore connects **internal capacity conditions** with **external value delivery**.

---

26. HEE Diagnostic Card

Signal	HEE Question	Next Move
Depletion / Overload	What is draining capacity?	**Recover**

Signal	HEE Question	Next Move
Missing Capability	What must be developed?	**Develop**
Fragmented Capability	Where does value break at the interface?	**Connect**
Constrained Capability	What prevents capable people from acting?	**Enable**
Failing Execution	What condition is hurting results now?	**Stabilize / Execute**
Repeating Failure	What are we failing to learn?	**Learn / Adapt**
Weak Future Capacity	Are today's results consuming tomorrow's capacity?	**Protect / Renew**
Negative EX	What system conditions may be creating drain?	**Investigate**
Negative CX	What internal conditions may be visible externally?	**Investigate**
Weak Value Creation	Where is capacity consumed without proportional value?	**Diagnose**

---

27. The HEE Test

> **Can the organization consistently deliver the experience and outcomes it needs to deliver—without consuming the capacity required to do it again?**

A result achieved by consuming the capacity required for the next cycle is not, by itself, evidence of sustainable execution.

---

28. HEE Maturity Path

```
AWARENESS
    ↓
MEASUREMENT
    ↓
PROTECTION
    ↓
RECOVERY
    ↓
DEVELOPMENT
    ↓
CONNECTION
```

```
    ↓
ENABLEMENT
    ↓
EXECUTION EXCELLENCE
    ↓
SUSTAINED EXECUTION
    ↓
SUSTAINABLE EXECUTION CAPACITY
    ↓
SUSTAINABLE VALUE CREATION
```

Maturity is developmental rather than strictly sequential.

Organizations may progress unevenly across dimensions.

Maturity means becoming better at:

seeing loss · removing unnecessary work · developing capability · connecting work · enabling action · executing reliably · learning · renewing capacity · creating sustainable value

---

29. Fundamental HEE Questions

1. **Is demand necessary and proportionate to the value required?**
2. **Do we have the Human Energy required to act?**
3. **Do we have the capability required?**
4. **Can the required capabilities work together?**
5. **Are decisions sufficiently timely and effective?**
6. **Are organizational conditions enabling application?**
7. **Can available capacity and capability become effective application?**
8. **Is execution creating sustainable value?**
9. **Is today's execution preserving the capacity required for tomorrow?**

Central Diagnostic Question

> **What limits application?**

---

30. Question Transformation

Traditional Question	HEE Question
Why are employees unproductive?	What is draining, fragmenting, constraining, or underutilizing capacity?

Traditional Question	HEE Question
Why are people not performing?	What prevents available capacity and capability from becoming effective application?
Do we need more people?	Is the limitation capacity—or are existing capabilities fragmented or constrained?
Do we need more training?	Is capability missing—or is existing capability disconnected or constrained?
Why are departments not cooperating?	Where does capability break across interfaces and handoffs?
Why are decisions slow?	What prevents required capacity from being deployed at the point of decision?
Why is technology not improving performance?	What prevents available technology and capability from being effectively applied?
How do we improve productivity?	How do we increase valuable application without unnecessarily degrading future capacity?
How do we sustain performance?	How do we preserve and renew the capacity required for future execution?
Why is customer experience inconsistent?	What internal fragmentation or enablement failure may be becoming visible to customers?

---

31. Strategic Perspectives

Perspective	Core Question
Economic	Is Human Energy and Organizational Capacity creating proportional value?
Employee Experience	Is Human Energy being protected and regenerated?
Customer Experience	Is capacity being converted into consistent customer value?
Business Consequences	What happens economically when capacity is poorly managed?

These perspectives complement rather than replace the HEE diagnostic architecture.

---

32. The HEE Operating Architecture

HEE is the theory and economic lens.

OEOS is the organizational operating architecture through which HEE is translated into practice.

HEMS manages Human Energy.

OSF + 5R reduce unnecessary operational noise.

Capability Interconnection addresses disconnection.

HEEn addresses organizational enablement.

EES supports execution, monitoring, learning, control, and adaptation.

```
HEE
Theory / Economic Lens
        ↓
OEOS
Operating Architecture
        ↓
HEMS · OSF + 5R · Capability Interconnection · HEEn
        ↓
EES
Execution
        ↓
SUSTAINABLE EXECUTION CAPACITY
        ↓
SUSTAINABLE BUSINESS VALUE
```

OEOS does not seek zero friction.

Its purpose is to **reduce avoidable drain and improve the conditions under which organizations can execute repeatedly**.

---

33. Execution Excellence System (EES)

EES is the execution-focused architecture within the HEE operating model.

A developing EES architecture includes:

IECA — Integrated Execution Capability Assessment
Assesses execution capability and conditions.

IECD — Integrated Execution Capability Diagnostic
Diagnoses conditions affecting execution.

ECI — Execution Constraint Intelligence
Identifies and prioritizes constraints that most limit execution.

Conceptually:

```
IECA
 ↓
IECD
 ↓
ECI
 ↓
PRIORITIZE
 ↓
FIX
 ↓
CONTROL
 ↓
ADAPT
 ↓
GROW
```

These constructs remain **subject to further conceptual development and empirical validation**.

---

34. The Interaction Proposition

HEE proposes that effective application depends on the relationship between **required demand** and the organization's Human Energy, capability, connection, decision quality, and enablement.

```
DEMAND
   ↓
HUMAN ENERGY
CAPABILITY
CONNECTION
DECISION QUALITY
ENABLEMENT
   ↓
EFFECTIVE APPLICATION
   ↓
EXECUTION
   ↓
SUSTAINED EXECUTION
   ↓
SUSTAINABLE EXECUTION CAPACITY
```

```
    ↓
SUSTAINABLE BUSINESS VALUE
```

This is a **conceptual interaction proposition—not a mathematical production function**.

The factors are not assumed to be directly commensurable or mathematically multiplicative.

---

35. Research Position

HEE is a conceptual management theory intended for:

- practical application;
- research;
- measurement development;
- experimentation;
- comparative study;
- longitudinal analysis; and
- empirical validation.

HEE does not claim that Human Energy alone determines organizational performance.

Markets, competition, finance, regulation, technology, leadership, culture, customer behavior, and external conditions also influence outcomes.

HEE's constructs, relationships, and propositions remain subject to empirical testing and refinement.

---

36. Research Questions

Research Area	Question
Construct Validity	Can Human Energy, Organizational Drain, Capacity, Disconnection, Constraint, and Sustainable Execution Capacity be reliably measured?
Relationship Testing	Do the proposed relationships hold empirically?
Causal Mechanisms	Does reducing avoidable drain improve effective application?
Boundary Conditions	How does HEE vary across industries, roles, technologies, and contexts?
Outcome Validation	Does Sustainable Execution Capacity relate to sustainable business value?
Longitudinal Testing	Does protecting capacity today improve future execution capacity?
Capability–Capacity Relationship	Under what conditions does capability become usable capacity and effective application?

Research Area	Question
Conversion Testing	What explains residual Conversion Failure after the other conditions have been examined?

37. Governing Principles

Assets & Lens

1. **HEE is an economic and management lens.**
2. **Organizational Capacity and Human Energy are economic assets.**

Capability → Capacity → Application → Execution

1. **Capability is potential.**
2. **Capacity is the ability to mobilize and apply potential.**
3. **Application is potential brought into purposeful action.**
4. **Execution converts application into intended results.**

Governing Questions

1. **What prevents the organization from turning its capacity and Human Energy into sustainable results?**
2. **What limits application?**

Diagnostic Architecture

1. **Six execution factors:** Demand · Human Energy · Capability · Connection · Decision Quality · Enablement.
2. **Five diagnostic conditions:** Depletion · Deficiency · Disconnection · Constraint · Conversion Failure.
3. **Five diagnostic responses:** Recover · Develop · Connect · Enable · Investigate.

Management & Value

1. **Protect is the cross-cutting preventive principle.**
2. **Diagnose before prescribing.**
3. **Increase valuable application and sustained execution without unnecessarily degrading future capacity.**
4. **Renew and reinvest in the capacity required for future execution.**

   Extraction depletes. Cultivation compounds.

38. The Canonical HEE Statement

> **Human Energy Economics (HEE) is a theory of organizational capacity and sustainable execution that examines how organizations preserve, develop, connect, enable, mobilize, and apply capacity across successive execution cycles.**
>
> **HEE distinguishes capability as potential from capacity as the ability to mobilize and apply that potential, and distinguishes effective application from execution and sustainable execution.**
>
> **HEE distinguishes legitimate capacity consumption from organizational drain and diagnoses Depletion, Deficiency, Disconnection, Constraint, and Conversion Failure as conditions that can limit effective application.**
>
> **Its objective is not to minimize work or energy consumption, but to increase valuable application and sustained execution without unnecessarily degrading the capacity required for future execution.**

In one line:

> **Consumption ≠ Drain ≠ Deficiency ≠ Disconnection ≠ Constraint.**
>
> **Extraction depletes. Cultivation compounds.**

---

39. The HEE Promise

Identify the drain.

Find the constraint.

Enable the capacity.

Apply the capability.

Sustain the execution.

Build the capacity for sustainable growth.

---

40. Origin

HEE was originated and developed by **Md. Mozammel Hoque**.

HEE Ecosystem

HEE · OEOS · HEMS · HEA · HERF · HEDP · HEEn · OSF · 5R Cascade · Capability Interconnection · EES

---

41. Final Position

Human Energy Economics reframes organizational performance through an economic question:

> **How can organizations create value today while preserving and strengthening the capacity required to create value tomorrow?**

HEE therefore focuses not only on **what organizations produce**, but on **what they consume, what they preserve, what they can mobilize, what they can apply, and what they can sustain**.

> **The objective is sustained value creation without self-consumption.**
