

HUMAN ENERGY ECONOMICS (HEE)

A Theory of Organizational Capacity and Sustainable Execution

Md. Mozammel Hoque
Independent Management Researcher
Originator of Human Energy Economics (HEE)

Version 1.0 — Canonical Edition
Date: 2 September 2026

THE HEE IDENTITY

Element	HEE Position
Theory	Human Energy Economics (HEE)
Core Domain	Organizational Capacity and Sustainable Execution
Economic Assets	Human Capital · Human Energy · Organizational Capacity
Six Execution Factors	Demand · Human Energy · Capability · Connection · Decision Quality · Enablement
Five Diagnostic Conditions	Depletion · Deficiency · Disconnection · Constraint · Conversion Failure
Five Diagnostic Responses	Recover · Develop · Connect · Enable · Investigate
Cross-Cutting Principle	Protect
Value Objective	Increase valuable application and sustained execution without unnecessarily degrading the capacity required for future execution
Ultimate Objective	Sustained value creation without self-consumption

HEE in One Sentence

HEE examines how organizations preserve, develop, connect, enable, mobilize, and apply human and organizational capacity across successive execution cycles so that value can be created today without unnecessarily consuming the capacity required to create value tomorrow.

1. THE THREE-WAY ONTOLOGICAL DISTINCTION

The foundational HEE distinction

Human Capital $\neq$ Human Energy $\neq$ Organizational Capacity

These are related but distinct constructs operating at different conceptual levels.

Construct	Definition	What it primarily represents	Level
Human Capital	Capability embodied in people	Knowledge, skills, expertise, experience, judgment, productive capability	Human
Human Energy	Human capacity available to mobilize and apply capability under actual conditions	Cognitive, emotional, and physical capacity available for action	Human
Organizational Capacity	Organization-level ability and means to mobilize, coordinate, enable, and sustain action	Structures, resources, systems, processes, information, decisions, relationships, technology, and other enabling conditions	Organizational

Core distinction

Question	Construct
What do people know and know how to do?	Human Capital
What human capacity is available to mobilize and apply that capability?	Human Energy
What organizational ability and conditions allow capability and human capacity to be mobilized, coordinated, and sustained?	Organizational Capacity

Therefore:

Human Capital is not Human Energy.

Human Energy is not Organizational Capacity.

Organizational Capacity is not simply the sum of Human Energy.

2. CORE PRINCIPLES

Principle	HEE Position
Economic	Organizational drain is an economic problem—not merely an employee problem
Ontology	Human Capital ≠ Human Energy ≠ Organizational Capacity
Capability	Capability is potential
Capacity	Capacity is the ability to mobilize and apply potential under actual conditions
Application	Application is capability and capacity brought into purposeful action
Execution	Execution converts application into intended action and results
Sustainability	Sustained execution requires preserving and renewing capacity for subsequent execution
Asset Logic	Human Energy and Organizational Capacity are finite economic resources in practical operating conditions
Management	Organizations should be managed not only for output, but for preservation and expansion of the capacity required to produce output repeatedly

3. FOUNDATIONAL DISTINCTION

A central HEE distinction is:

Consumption ≠ Drain ≠ Deficiency ≠ Disconnection ≠ Constraint

Concept	HEE Meaning	Key Question
Consumption	Necessary or legitimate use of capacity in performing work	What capacity must legitimately be used?
Drain	Unnecessary depletion, impairment, diversion, or loss of capacity relative to value created or legitimately expected	What capacity is being consumed without sufficient value?
Deficiency	Required capability or capacity is genuinely missing or insufficient	What is missing?
Disconnection	Existing capability cannot work together effectively	What cannot connect?
Constraint	Available capability/capacity cannot be effectively mobilized or applied because of organizational conditions	What prevents application?

Concept	HEE Meaning	Key Question
Conversion Failure	Sufficiently available, connected, and enabled capability/capacity still fails to become intended action	Why is available capacity still not converting into action?

Critical principle

The response depends on the condition—not merely on the symptom.

These conditions may coexist and interact.

4. CAPABILITY, CAPACITY, APPLICATION, AND EXECUTION

Concept	HEE Definition	Simple Question
Capability	Potential to perform	What could we do?
Capacity	Ability to mobilize and apply potential under actual conditions	What can we bring into action?
Effective Application	Available capability and capacity brought into purposeful action	What are we actually applying?
Execution	Application realized into intended action and results	What are we accomplishing?
Sustained Execution	Results produced repeatedly without unnecessarily degrading future capacity	Can we do it again?

Core HEE formulation

Capability = Potential.

Capacity = Ability to mobilize and apply potential.

Application = Potential brought into purposeful action.

Execution = Application producing intended results.

Knowledge and application

Knowledge alone is potential.

Applied knowledge is power.

Knowledge may contribute to capability.

Capability becomes economically useful when it can be mobilized, connected, enabled, applied, and converted through execution.

5. HUMAN CAPITAL, HUMAN ENERGY, AND ORGANIZATIONAL CAPACITY

	Human Capital	Human Energy	Organizational Capacity
Core meaning	Capability embodied in people	Human capacity available to mobilize/apply capability	Organizational ability and means to mobilize, coordinate, enable, and sustain action
Primary concern	Potential	Availability/readiness for application	System-level ability and conditions
Examples	Knowledge, skills, expertise, experience, judgment	Focus, cognitive capacity, emotional capacity, physical capacity	Resources, structures, processes, information, decision rights, technology, coordination
Can exist without the others?	Yes	Yes	Yes
Economic role	Provides capability	Provides human capacity to apply capability	Provides broader conditions and means for application
HEE risk	Capability remains unrealized	Capability cannot be mobilized	Capability and energy cannot be effectively coordinated/applied

Important implication

A highly capable organization can still fail to execute.

Why?

Because:

Capability may exist without sufficient Human Energy.

Human Energy may exist without sufficient capability.

Both may exist while Organizational Capacity remains constrained.

6. FROM CAPACITY TO EFFECTIVE APPLICATION

The relationship can be represented as:

Human Capital

→ Capability

Human Energy

→ Human capacity to mobilize/apply capability

Organizational Capacity

→ Organizational means and conditions for mobilization, coordination, enablement, and sustained action

↓

Available Capability + Usable Capacity

↓

Effective Application

↓

Execution

↓

Sustained Execution

↓

Sustainable Execution Capacity

↓

Sustainable Business Value

This is a conceptual relationship, not a strictly linear production function.

7. THE FOUR GOVERNING QUESTIONS

HEE is governed by four questions.

Governing Question	Purpose
1. Economic Question — How can organizations create value today while preserving and strengthening the capacity required to create value tomorrow?	Establishes the economic orientation
2. Diagnostic Question — What prevents available capability and capacity from becoming effective application and sustained execution?	Establishes the diagnostic focus
3. Intervention Question — What condition most limits sustainable execution, and what must change?	Establishes the intervention logic
4. Protection Question — How do we preserve the capacity required for future execution?	Establishes the sustainability requirement

Governing architecture

CREATE VALUE → DIAGNOSE THE LIMIT → CHANGE THE CONDITION → PROTECT FUTURE CAPACITY

These four questions govern the theory; they are not four separate diagnostic frameworks.

8. THE HEE PROBLEM

Organizations can possess:

- capable people
- sophisticated technology
- strong processes
- financial resources
- expertise
- data
- systems
- strategy

and still execute below potential.

Growth increases:

Growth creates more...	Which can create...
People	More coordination
Functions	More interfaces
Systems	More dependencies

Growth creates more...	Which can create...
Decisions	More decision points
Processes	More handoffs
Information	More cognitive demand
Customers	More exceptions
Scale	More complexity

Therefore:

An organization may not have become less capable. It may have become more interconnected without becoming better connected.

The resulting problem may not be lack of capability.

It may be the inability to:

mobilize → connect → direct → enable → apply → execute

existing capability.

9. A POSSIBLE ORGANIZATIONAL PATHWAY

HEE proposes the following as a diagnostic narrative:

Stage	Potential condition
1. Organizational Fragmentation	Capability and activity become increasingly distributed
↓	
2. Operational Noise + Disconnected Capability	Coordination burden and weak interfaces increase
↓	
3. Human Energy Loss + Application Constraints	Available capacity becomes harder to mobilize and apply
↓	
4. Organizational Drain	Capacity is consumed, diverted, impaired, or lost without proportional value
↓	

Stage	Potential condition
5. Execution Degradation	Intended action becomes less reliable
↓	
6. Customer Friction	Internal conditions become externally visible
↓	
7. Value Loss	Sustainable business value is reduced

This is a **hypothesized diagnostic pathway**, not a universal causal law.

10. WHY EXISTING APPROACHES MAY BE INSUFFICIENT

HEE does not reject existing disciplines.

Existing approach	Common focus	HEE adds the question of...
Employee Wellness	Human wellbeing/symptoms	What organizational conditions consume capacity?
Productivity Optimization	Output relative to measured inputs	What capacity is being consumed to create output?
Strategy	Direction and priorities	Can the organization execute sustainably?
Process Improvement	Flow and process performance	Does process design preserve application capacity?
Talent Management	Capability development	Can capability actually be applied?
Engagement	Motivation/involvement	What enables sustained contribution?
Technology	Automation/acceleration	Does technology increase Sustainable Execution Capacity?

HEE asks:

How do Human Capital, Human Energy, and Organizational Capacity become effective application, sustained execution, and sustainable business value?

11. HEE'S ECONOMIC VIEW OF ORGANIZATIONAL CAPACITY

Organizational Capacity is an economic construct in the management sense.

It represents the organization's ability and means to:

Organizational capacity enables...
Mobilize capability
Coordinate distributed capability
Make and implement decisions
Allocate resources
Process information
Enable action
Execute
Learn
Adapt
Sustain future execution

This does **not** mean Organizational Capacity is an accounting asset.

It is an economic construct describing organizational productive ability.

12. HUMAN ENERGY AS AN ECONOMIC RESOURCE

Human Energy is the cognitive, emotional, and physical capacity available to people for work and application.

Human Energy enables...
Focus
Thinking
Decision-making
Collaboration

Human Energy enables...

Creation

Learning

Adaptation

Action

HEE therefore treats Human Energy as:

- a human-level economic asset
- a contributor to usable organizational capacity
- a condition influencing capability application
- something that can be depleted
- something that can be protected
- something that can be recovered
- something that can be developed in relevant respects
- something that can be enabled
- something that can be applied
- something that can be renewed

But:

Human Energy is not the whole of Organizational Capacity.

13. HUMAN CAPITAL AND HUMAN ENERGY

Human Capital	Human Energy
Capability embodied in people	Capacity available to mobilize/apply capability
What people know	Capacity to think
What people can perform	Capacity to focus
What people can solve	Capacity to decide
What people can create	Capacity to collaborate
Potential	Availability for application

Two important propositions

Human Capital without available Human Energy may remain unrealized capability.

Human Energy without sufficient Human Capital may lack the capability required for effective action.

And even both together may fail if Organizational Capacity does not enable application.

14. FROM CAPACITY TO VALUE

Stage	HEE logic
Human Capital	Provides capability
Human Energy	Provides human capacity
Organizational Capacity	Provides organizational means and conditions
↓	
Available Capability + Usable Capacity	Potential becomes available for application
↓	
Diagnose the Limit	Identify what prevents application
↓	
Recover / Develop / Connect / Enable / Investigate	Change the limiting condition
↓	
Effective Application	Capability and capacity become purposeful action
↓	
Execution	Action produces intended results
↓	
Sustained Execution	Results can be repeatedly produced
↓	
Sustainable Execution Capacity	Future execution ability is preserved/ strengthened
↓	
Sustainable Business Value	Value can be created and renewed
↻	Renew / Reinvest

Extraction depletes. Cultivation compounds.

15. HEE OBJECTIVE

Strategic Objective

Better execution today. Stronger capacity tomorrow.

Economic Objective

Increase valuable application and sustained execution without unnecessarily degrading the capacity required for future execution.

HEE does not seek to...	HEE seeks to...
Minimize all work	Minimize unnecessary work
Minimize all energy consumption	Reduce unnecessary depletion
Eliminate demand	Eliminate unnecessary demand
Maximize utilization	Increase valuable application
Optimize activity for its own sake	Optimize value-producing application
Simply increase output	Increase sustainable execution
Extract more from existing capacity	Preserve and strengthen future capacity

16. HEE DIAGNOSTIC ARCHITECTURE

HEE identifies five primary diagnostic conditions.

Diagnostic Condition	Meaning	Primary Response
Depletion	Available capacity has been depleted or impaired	Recover
Deficiency	Required capability/capacity is missing or insufficient	Develop
Disconnection	Existing capabilities cannot work together effectively	Connect
Constraint	Capability/capacity exists but organizational conditions prevent application	Enable

Diagnostic Condition	Meaning	Primary Response
Conversion Failure	Available, connected, enabled capability/capacity still fails to become intended action	Investigate

Critical rule

Do not automatically fix the largest gap. Fix the condition that most limits sustainable execution.

17. DIAGNOSTIC DECISION SEQUENCE

Diagnostic test	If true	Response
Depleted?	Capacity has been impaired/depleted	Recover
Missing?	Required capability/capacity is insufficient	Develop
Disconnected?	Existing capabilities cannot work together	Connect
Constrained?	Organizational conditions prevent application	Enable
Failing to convert?	Available, connected, enabled capacity still fails to become action	Investigate

↓

Effective Application

Conversion Failure should be considered after the other conditions have been reasonably examined or excluded.

18. ORGANIZATIONAL DRAIN

HEE Definition

Organizational Drain is the economic condition in which organizational capacity is consumed, depleted, impaired, diverted, or lost without sufficient productive contribution, necessary protection, capability development, or legitimate expected future value.

Possible source	Possible mechanism
Unnecessary demand	Recurring consumption

Possible source	Possible mechanism
Operational noise	Repeated friction
Rework	Capacity duplication
Poor configuration	Avoidable effort
Capability disconnection	Coordination loss
Organizational constraint	Blocked application
Ineffective application	Wasted available capacity
Preventable interruption	Human Energy depletion
Excess dependency	Coordination burden

Important distinction

Operational Noise can be a source, mechanism, or manifestation of Organizational Drain—but it is not identical to Organizational Drain.

19. THE HUMAN ENERGY ECONOMIC QUESTION

Work necessarily consumes Human Energy.

Therefore, consumption itself is not the problem.

The economic question is:

Does the Human Energy consumed in work produce sufficient present value or legitimate future value without unnecessarily degrading the capacity required for subsequent execution?

This shifts the management question from:

“Are people working too hard?”

to:

“What capacity are we consuming, why are we consuming it, what value is being created, and what capacity remains for the next cycle?”

20. BURNOUT-RELATED CAPACITY DEPLETION AS A SIGNAL

HEE treats burnout-related depletion as a possible signal requiring investigation.

HEE does not claim	HEE does examine
All burnout is organizationally caused	Whether organizational conditions contribute
All depletion means organizational failure	Whether capacity is being unnecessarily depleted
Individuals are responsible for systemic conditions	What system conditions may be involved

Diagnostic pathway

Capacity Depletion Signal

↓

Possible Human Energy Depletion

↓

Investigate Conditions

↓

Demand / Noise / Disconnection / Constraint / Deficiency

↓

System Diagnosis

↓

Appropriate Intervention

The objective is diagnosis rather than blame.

21. CORE HEE CONCEPTS

Concept	HEE Meaning
Human Capital	Capability embodied in people
Human Energy	Human capacity available to mobilize and apply capability
Organizational Capacity	Organizational ability and means to mobilize, coordinate, enable, and sustain action
Usable Capacity	Capacity actually available for productive or strategically valuable application under current conditions
Capability	Potential to perform
Capacity	Ability to mobilize and apply potential under actual conditions

Concept	HEE Meaning
Effective Application	Available capability and capacity brought into purposeful action
Execution	Application realized into intended action and results
Sustained Execution	Repeated execution without unnecessarily degrading future capacity
Sustainable Execution Capacity	Future-oriented ability and readiness preserved or strengthened through current execution
Sustainable Business Value	Value created and renewed through sustained execution without unnecessarily degrading future capacity

22. THE SIX EXECUTION FACTORS

HEE identifies six broad execution factors:

Demand · Human Energy · Capability · Connection · Decision Quality · Enablement

These are **not the same as the five diagnostic conditions**.

Six Execution Factors	What they influence
Demand	How much capacity is required
Human Energy	How much human capacity is available
Capability	What potential exists
Connection	Whether distributed capability can work together
Decision Quality	Whether action is appropriately directed
Enablement	Whether organizational conditions permit action

Together they influence whether capability can become effective application and execution.

23. DEMAND

Dimension	HEE Position
Definition	Volume, intensity, complexity, interruption burden, and other requirements placed on capacity
Positive role	Necessary demand can create value

Dimension	HEE Position
Problem	Demand becomes problematic when unnecessary, duplicative, disproportionate, avoidable, or poorly designed
HEE concern	Whether demand should exist in its current form
Strategic question	Should this demand exist?

HEE does not treat all demand as waste.

The objective is to distinguish:

Necessary productive demand from unnecessary recurring demand.

24. HUMAN ENERGY AS AN EXECUTION FACTOR

Human Energy determines how much human capacity is available to mobilize and apply capability.

Influencing condition	Possible effect
Workload	Energy consumption
Interruption	Attention fragmentation
Context switching	Cognitive demand
Emotional demand	Reduced available capacity
Recovery opportunity	Capacity restoration
Organizational friction	Unnecessary depletion
Role conditions	Availability for application
Environment	Capacity to focus and act

Human Energy is therefore both:

an economic asset

and

an execution condition.

25. CAPABILITY AS AN EXECUTION FACTOR

Capability represents potential.

Capability includes...

Knowledge

Skills

Expertise

Experience

Judgment

Competence

Problem-solving ability

Creative ability

The HEE question is not simply:

“Do we have capable people?”

It is:

“Can available capability become effective application under actual conditions?”

26. CONNECTION AS AN EXECUTION FACTOR

Connection concerns whether distributed capabilities can work together effectively.

Connection may involve...

People

Teams

Functions

Processes

Information

Systems

Technology

Connection may involve...

Decisions

Interfaces

Handoffs

Therefore:

Distributed capability becomes organizational capability only when it can be effectively connected and applied.

27. DECISION QUALITY

Decision Quality is the degree to which decisions are:

- timely
- sufficiently informed
- appropriately authorized
- contextually appropriate
- actionable

Possible condition	Potential effect on decision quality
Insufficient information	Poor direction
Unclear decision rights	Delay
Cognitive overload	Reduced judgment
Excessive demand	Decision degradation
Capability deficiency	Weak decision quality
Disconnection	Fragmented information
Enablement constraint	Inability to act

HEE does not automatically treat poor decisions as the root cause.

Diagnose the underlying condition.

28. ENABLEMENT

Enablement concerns the organizational conditions that permit capability and human capacity to be effectively applied.

Enablement domain	Examples
Resources	Time, budget, tools
Structure	Roles, responsibilities, interfaces
Decision	Authority, rights, escalation
Information	Access, quality, visibility
Process	Flow, rules, procedures
Technology	Systems, platforms, automation
Leadership	Direction, support, protection
Environment	Conditions surrounding work

Core principle

Do not ask only whether people are capable. Ask whether the organization has enabled their capability to be applied.

29. ASSET-TO-VALUE LOGIC

Asset / Condition	Contribution
Human Capital	Capability
Human Energy	Human capacity
Organizational Capacity	Organizational means and conditions
↓	
Usable Capability + Usable Capacity	Available potential
↓	
Diagnosis	Identify what limits application
↓	
Recover / Develop / Connect / Enable / Investigate	Change the limiting condition

Asset / Condition	Contribution
↓	
Effective Application	Purposeful use of capability/capacity
↓	
Execution	Intended action/results
↓	
Sustained Execution	Repeated execution
↓	
Sustainable Execution Capacity	Future execution ability
↓	
Sustainable Business Value	Durable value
↻	Renew / Reinvest

30. SUSTAINABLE EXECUTION CAPACITY

Concept	Meaning
Current Output	What the organization produces now
Sustained Execution	Ability to repeatedly produce intended results
Sustainable Execution Capacity	Future ability and readiness to continue executing after current cycles

An organization can increase current output while reducing future execution capacity.

Examples include:

- exhausting people
- accumulating rework
- increasing technical debt
- weakening learning
- increasing hidden dependencies
- suppressing improvement
- consuming future capability

Therefore:

Current output can increase while future execution capacity decreases.

31. SUSTAINABLE BUSINESS VALUE

Short-term view	HEE view
Revenue today	Value today + capacity for future value
Output	Valuable application
Speed	Sustainable execution
Utilization	Usable capacity
Efficiency	Productive contribution without unnecessary depletion
Immediate result	Result + future execution capacity

HEE definition

Sustainable Business Value is value that can be created and renewed through sustained execution without unnecessarily degrading the capacity required for future value creation.

32. HEE MANAGEMENT LOGIC

The HEE management cycle is:

**PROTECT → DIAGNOSE → RECOVER / DEVELOP / CONNECT / ENABLE / INVESTIGATE →
APPLY → EXECUTE → LEARN → ADAPT → RENEW**

Stage	Management purpose
Protect	Prevent unnecessary degradation
Diagnose	Identify the limiting condition
Recover	Restore depleted capacity
Develop	Build missing capability
Connect	Connect fragmented capability
Enable	Remove organizational barriers
Investigate	Understand residual conversion failure
Apply	Convert available potential into purposeful action
Execute	Produce intended results

Stage	Management purpose
Learn	Capture experience
Adapt	Change according to learning and conditions
Renew	Preserve and strengthen future capacity

Protect is cross-cutting, not a sixth diagnostic condition.

33. PRIORITIZATION

HEE proposes:

$$\text{Priority} = \text{Urgency} \times \text{Dependency} \times \text{Value Impact}$$

This is a **heuristic**, not a validated universal law.

Priority dimension	Meaning
Urgency	How quickly the condition requires attention
Dependency	How strongly it blocks other activity
Value Impact	Potential consequence for value creation

Priority rule

Fix the condition that most prevents the system from moving forward.

Not necessarily:

“Fix the largest gap.”

34. HUMAN ENERGY MANAGEMENT SYSTEM (HEMS)

HEMS is a management subsystem within HEE.

HEMS Component	Purpose
HEA — Human Energy Audit	Measure and diagnose Human Energy conditions
HERF — Human Energy Recovery Framework	Recover depleted Human Energy and reduce conditions contributing to unnecessary depletion

HEMS Component	Purpose
HEDP — Human Energy Development Plan	Develop Human Capital, capability, and relevant human capacity
Capability Interconnection	Connect distributed capabilities
HEEn — Human Energy Enablement	Enable effective application
EES — Execution Excellence System	Execute, monitor, control, learn, adapt, and grow

HEMS is a subsystem—not the HEE theory itself.

35. OPERATIONAL SILENCE FRAMEWORK + 5R

OSF addresses unnecessary operational demand and Operational Noise.

Operational Silence means:

Reduced unnecessary operational demand and recurring friction that consume organizational capacity without proportional value.

It does **not** mean:

- employee silence
- suppression of voice
- reduced communication
- inactivity

OSF logic

Stage	Effect
Unnecessary Operational Demand	Creates avoidable work
↓	
Operational Noise	Creates recurring friction
↓	
Human Energy + Organizational Capacity Consumption	Consumes usable capacity
↓	
Reduced Usable Capacity	Less capacity available

Stage	Effect
↓	
Execution Constraint	Application becomes harder
↓	
Value Loss	Reduced sustainable value

OSF is an intervention mechanism within HEE.

36. THE 5R CASCADE

5R	Purpose
REMOVE	Eliminate demand that should not exist
REDUCE	Reduce demand that must remain
REPLACE	Substitute better mechanisms
RE-ENGINEER	Redesign the underlying system/process
RETAIN	Protect the improvement

Principle

Never reduce what you can remove.

Simplification principle

Simplify before you automate.

Automation should not simply make unnecessary complexity faster.

37. THE 3C STRATEGIC LENS

3C	Strategic focus
Continuous Improvement	Eliminate recurring demand at source
Continuous Empowerment	Reduce unnecessary dependency
Continuous Constraint Reduction	Improve systemic flow

Relationship

3C asks WHERE to intervene.

5R determines HOW to intervene.

3C and 5R are management methods, not causal upstream factors.

38. CAPACITY RECOVERY

OSF can release organizational capacity.

But:

Released hours $\neq$ Human Energy automatically recovered.

Released capacity may become...

Recovery opportunity

Redeployed capacity

Learning

Improvement

Innovation

Additional value creation

Protected future capacity

The released capacity should therefore be intentionally:

Recovered $\rightarrow$ Redirected $\rightarrow$ Reinvested $\rightarrow$ Protected

where appropriate.

39. CAPABILITY ARCHITECTURE

HEE recognizes capability across levels:

Individual $\rightarrow$ Team $\rightarrow$ Functional $\rightarrow$ Organizational

Level	Capability concern
Individual	Personal knowledge and competence
Team	Collective performance
Functional	Specialized organizational capability
Organizational	Integrated system-level capability

Capability at one level does not automatically become capability at the next.

Therefore:

Distributed capability becomes organizational capability only when it can be effectively connected and applied.

40. ORGANIZATIONAL ENABLEMENT

Enablement domain	What it makes possible
Resources	Capacity to act
Structure	Clear coordination
Decision rights	Appropriate authority
Information	Informed action
Processes	Reliable flow
Technology	Appropriate execution support
Leadership	Direction and protection
Environment	Conditions for sustained application

Core principle

Capability without enablement may remain unrealized potential.

41. TECHNOLOGY AND AI

Technology may:

Technology can...

Reduce demand

Increase capability

Improve connection

Improve decision quality

Improve enablement

Accelerate execution

But technology may also increase:

- complexity
- dependencies
- monitoring
- information volume
- capability requirements
- coordination burden
- speed of dysfunctional processes

HEE technology test

Does technology increase Sustainable Execution Capacity—or simply increase the speed of complexity?

42. EX / CX

HEE treats Employee Experience and Customer Experience as complementary downstream signals of organizational conditions.

Perspective	Signal
Inside-Out	EX reveals internal organizational conditions
Outside-In	CX reveals external consequences
EX → CX	Internal conditions may affect customer experience
CX → EX	Customer feedback may reveal internal system conditions
Mirror Effect	Internal strain and external friction may reflect common upstream conditions

HEE does not assume that EX always causes CX or CX always causes EX.

Both may be downstream signals of upstream organizational conditions.

43. SLA → XLA → HEE

Framework	Primary protection
SLA	Operational performance
XLA	Customer/user experience
HEE	Organizational capacity required to sustain both

Therefore:

SLA protects operations. XLA protects experience. HEE protects the capacity that sustains both.

44. THE HEE DIAGNOSTIC CARD

Signal	Diagnostic direction	Next Move
Depletion / Overload	What is draining capacity?	Recover
Missing Capability	What capability is insufficient?	Develop
Fragmented Capability	Where does value break at interfaces?	Connect
Constrained Capability	What prevents capable people from acting?	Enable
Failing Execution	What condition prevents intended results?	Stabilize / Execute
Repeating Failure	What is failing to be learned or adapted?	Learn / Adapt
Weak Future Capacity	Are today's results consuming tomorrow's capacity?	Protect / Renew
Negative EX	What system conditions contribute to energy loss/friction?	Investigate
Negative CX	What internal conditions may be externally visible?	Investigate
Weak Value Creation	Where is capacity consumed without proportional value?	Diagnose

45. HEE LEADERSHIP TEST

Leadership question	Purpose
What is the condition limiting application?	Diagnose
What is the consequence?	Establish significance
What must change next?	Determine intervention
Did we improve current execution without unnecessarily degrading future capacity?	Test sustainability

This keeps leadership diagnosis focused.

46. HEE OPERATING ARCHITECTURE

Layer	Role
HEE	Theory / Economic Lens
↓	
OEOS	Organizational Excellence Operating System
↓	
HEMS · HERF · HEDP · OSF + 5R · Capability Interconnection · HEE_n	Management Mechanisms
↓	
EES	Execution Architecture
↓	
Sustainable Execution Capacity	Future execution ability
↓	
Sustainable Business Value	Economic outcome

47. EXECUTION EXCELLENCE SYSTEM (EES)

EES architecture

IECA → IECD → ECI → PRIORITIZE → FIX → CONTROL → ADAPT → GROW

Component	Purpose
IECA — Integrated Execution Capability Assessment	Establish visibility
IECD — Integrated Execution Capability Diagnostic	Identify execution-limiting conditions
ECI — Execution Constraint Intelligence	Understand the highest-impact constraints
Prioritize	Select the constraint with greatest execution significance
Fix	Intervene
Control	Stabilize
Adapt	Learn and adjust
Grow	Expand Sustainable Execution Capacity

EES execution flow

**VISIBILITY → DIAGNOSE → CONSTRAINTS → CAPABILITY → ALIGN → EXECUTE →
MONITOR → ADAPT → OUTCOMES**

These constructs remain subject to measurement development and empirical validation.

48. ORGANIZATIONAL GROWTH

Growth can increase:

Growth variable	Potential consequence
People	Coordination
Systems	Dependencies
Decisions	Decision load
Interfaces	Handoffs

Growth variable	Potential consequence
Rules	Process complexity
Information	Cognitive demand
Exceptions	Operational noise
Functions	Fragmentation

This creates several HEE risks:

Capability can grow while connection weakens.

Technology can grow while enablement deteriorates.

Output can grow while Human Energy is depleted.

Complexity can grow faster than value.

49. SCALE CAPABILITY, NOT COMPLEXITY

Scale capability, not complexity.

Scale this...	Not merely this...
Capability	Activity
Connection	Coordination
Decision quality	Decision volume
Enablement	Rules
Learning	Rework
Adaptability	Exceptions
Sustainable Execution Capacity	Short-term output

50. SUSTAINABLE GROWTH

HEE defines sustainable growth through:

Create → Apply → Execute → Learn → Adapt → Renew → Create Again

Extractive growth	Cultivated growth
Consume existing capacity	Strengthen capacity
Increase output	Increase valuable application
Add complexity	Improve capability
Add dependencies	Improve connection
Accelerate work	Improve execution quality
Deplete capacity	Renew capacity

Extraction depletes. Cultivation compounds.

51. HEE MATURITY

This is a developmental architecture, not a universal linear sequence.

52. HEE RESEARCH POSITION

HEE is proposed as a:

Conceptual management theory and economic lens for organizational capacity and sustainable execution.

It is intended to support:

HEE does not claim that Human Energy alone determines organizational performance.

Outcomes are also influenced by:

- markets
- competition
- finance
- regulation

- technology
- leadership
- culture
- customer behavior
- external shocks
- institutional conditions

HEE's narrower proposition is:

The capacity required for execution is itself an economic concern.

53. RESEARCH AGENDA

Research area	Core question
Construct Validity	Are HEE constructs empirically distinguishable?
Relationship Testing	How are the constructs related?
Causal Mechanisms	How does drain affect application and execution?
Boundary Conditions	Where does HEE apply, and where does it not?
Outcome Validation	Do HEE conditions predict meaningful outcomes?
Longitudinal Validation	Can execution improvements persist without degrading future capacity?
Conversion Research	Under what conditions does capability become application and execution?

54. PROPOSITIONS FOR FUTURE TESTING

These are **propositions, not established laws**.

#	Proposition
1	Greater avoidable Organizational Drain is associated with lower usable capacity for effective application.
2	Human Capital does not guarantee effective application when Human Energy or organizational enablement is insufficient.
3	Connected capability is more likely to become effective organizational application than equivalent capability that remains fragmented.
4	Improved organizational enablement is likely to increase conversion of available capability and capacity into execution.

#	Proposition
5	Reducing unnecessary recurring demand may increase usable capacity when released capacity is not immediately replaced by equivalent demand.
6	Protection and renewal of execution capacity are associated with greater ability to sustain execution across successive cycles.

55. GOVERNING PRINCIPLES OF HEE

Principle	HEE Position
Economic Lens	Organizational capacity is an economic concern
Three-Way Ontology	Human Capital $\neq$ Human Energy $\neq$ Organizational Capacity
Capability	Capability is potential
Capacity	Capacity is ability to mobilize and apply potential
Application	Application brings potential into purposeful action
Execution	Execution realizes application into intended results
Sustainability	Current output does not automatically equal sustainable execution
Consumption	Consumption is not inherently drain
Drain	Drain concerns unnecessary depletion, impairment, diversion, or loss relative to value
Diagnosis	Diagnose before prescribing
Prioritization	Fix the condition that most limits sustainable execution
Recover	Recover depleted capacity
Develop	Develop missing capability
Connect	Connect fragmented capability
Enable	Remove conditions preventing application
Investigate	Investigate residual conversion failure
Protect	Protect current and future execution capacity
Demand	Do not optimize unnecessary work
Complexity	Do not confuse complexity with capability
Output	Do not confuse output with sustainability

Principle	HEE Position
Renewal	Renew and reinvest capacity after execution

56. THE HEE CENTRAL LOGIC

Layer	HEE logic
Human Capital	Provides capability
Human Energy	Provides human capacity to mobilize/ apply capability
Organizational Capacity	Provides broader organizational ability and conditions
↓	
Available Capability + Usable Capacity	Potential available for application
↓	
What limits application?	Identify the limiting condition
↓	
Depletion · Deficiency · Disconnection · Constraint · Conversion Failure	Diagnostic conditions
↓	
Recover · Develop · Connect · Enable · Investigate	Intervention responses
↓	
Effective Application	Purposeful application
↓	
Execution	Intended action/results
↓	
Learn + Adapt	Improve future execution
↓	
Sustained Execution	Repeated results
↓	
Sustainable Execution Capacity	Future execution ability

Layer	HEE logic
↓	
Sustainable Business Value	Value creation and renewal
↓	
Renew + Reinvest	Strengthen future capacity

57. THE HEE ECONOMIC PROPOSITION

Organizations create value through the application of capability and capacity, but the capacity consumed in creating present value also determines their ability to create future value.

Therefore:

The economics of execution cannot be separated entirely from the economics of capacity preservation.

The central economic question is:

How can organizations create value today while preserving and strengthening the capacity required to create value tomorrow?

58. THE HEE MANAGEMENT PROPOSITION

Organizations should therefore be managed not only for:

Traditional focus	HEE adds
Output	Valuable application
Speed	Sustainable execution
Utilization	Usable capacity
Efficiency	Productive contribution without unnecessary depletion
Productivity	Capacity preservation
Capability	Capability application
Technology	Sustainable Execution Capacity

Traditional focus	HEE adds
Short-term results	Current value + future capacity

The objective is:

Less unnecessary consumption. More valuable application. Stronger future capacity.

59. THE HEE DIFFERENTIATION

HEE is not simply the proposition that people matter.

Its more specific contribution is:

Human capacity is an economic resource in the execution system, and organizational performance depends not only on possessing capability but on preserving the capacity required to mobilize, connect, enable, apply, and repeatedly execute that capability.

This changes the management question.

Not merely:

“How do we get more output?”

But:

“What capacity are we consuming to produce this output, what value is being created, and what capacity will remain for the next cycle?”

60. THE HEE PRINCIPLE OF SUSTAINED VALUE

The objective is not simply maximum output.

It is:

Sustained value creation without self-consumption.

The cycle is:

CREATE VALUE

↓

APPLY CAPABILITY

↓
EXECUTE
 ↓
LEARN
 ↓
ADAPT
 ↓
RENEW CAPACITY
 ↓
CREATE VALUE AGAIN

This is the economic logic of sustainable execution.

61. HEE ARCHITECTURE AT A GLANCE

Architecture Layer	HEE Component	Role
1	HEE — Human Energy Economics	Theory / Economic Lens
2	OEOS — Organizational Excellence Operating System	Management / Operating Architecture
3	HEMS	Human Energy Management System
3	HERF	Human Energy Recovery Framework
3	HEDP	Human Energy Development Plan
3	OSF + 5R	Operational Silence / Demand Reduction Mechanism
3	Capability Interconnection	Connect distributed capability
3	HEEn	Human Energy Enablement
4	EES — Execution Excellence System	Execution Architecture
5	Sustainable Execution Capacity	Future execution ability
6	Sustainable Business Value	Economic outcome

62. HEE IN ITS SIMPLEST FORM

Fundamental statement	Meaning
Human Capital provides capability.	People possess potential
Human Energy provides human capacity to mobilize and apply capability.	People need available capacity to use potential
Organizational Capacity provides broader organizational ability and conditions.	The system must enable application
Capability is potential.	Potential is not execution
Capacity is ability to mobilize and apply potential.	Availability matters
Application turns potential into purposeful action.	Potential becomes action
Execution turns application into intended results.	Action becomes results
Sustained execution requires future capacity.	Today's success must not destroy tomorrow's ability
HEE diagnoses what limits application.	Find the actual condition
HEE protects future execution capacity.	Preserve the ability to execute again

63. THE FOUR GOVERNING QUESTIONS — FINAL FORM

Question	HEE formulation
Economic	How can organizations create value today while preserving and strengthening the capacity required to create value tomorrow?
Diagnostic	What prevents available capability and capacity from becoming effective application and sustained execution?
Intervention	What condition most limits sustainable execution, and what must change?
Protection	How do we preserve the capacity required for future execution?

In one line

CREATE VALUE → DIAGNOSE THE LIMIT → CHANGE THE CONDITION → PROTECT FUTURE CAPACITY

64. FINAL HEE POSITION

HEE establishes...	Core position
Theory	Human Energy Economics is a theory of organizational capacity and sustainable execution
Ontology	Human Capital $\neq$ Human Energy $\neq$ Organizational Capacity
Capability	Capability is potential
Capacity	Capacity is ability to mobilize and apply potential
Application	Application is purposeful realization of available capability/capacity
Execution	Execution converts application into intended action/results
Drain	Organizational Drain is an economic condition, not merely a human symptom
Diagnosis	Depletion · Deficiency · Disconnection · Constraint · Conversion Failure
Response	Recover · Develop · Connect · Enable · Investigate
Execution Factors	Demand · Human Energy · Capability · Connection · Decision Quality · Enablement
Management Principle	Protect
Economic Objective	Increase valuable application and sustained execution without unnecessarily degrading future capacity
Strategic Objective	Better execution today. Stronger capacity tomorrow
Ultimate Objective	Sustained value creation without self-consumption

Final HEE statement

Human Energy Economics (HEE) is a theory of organizational capacity and sustainable execution. It examines how organizations preserve, develop, connect, enable, mobilize, and apply human and organizational capacity across successive execution cycles. It distinguishes Human Capital as capability embodied in people, Human Energy as human capacity available to mobilize and apply that capability, and Organizational Capacity as the broader organizational ability and conditions through which capability and human capacity can be mobilized, coordinated, and sustained.

HEE distinguishes capability as potential from capacity as the ability to mobilize and apply potential, and distinguishes application from execution and sustained execution. It distinguishes legitimate consumption from Organizational Drain and diagnoses five conditions—Depletion, Deficiency, Disconnection, Constraint, and Conversion Failure—to determine what limits application and what intervention is required.

Its central economic concern is how organizations can create value today while preserving and strengthening the capacity required to create value tomorrow. Its objective is not to minimize work or consumption, but to increase valuable application and sustained execution without unnecessarily degrading future execution capacity.

Its ultimate objective is sustained value creation without self-consumption.

DOCUMENT INFORMATION

Field	Information
Title	Human Energy Economics (HEE): A Theory of Organizational Capacity and Sustainable Execution
Version	Version 1.0 — Canonical Edition
Date	2 September 2026
Status	Canonical conceptual theory; constructs, relationships, propositions, and measurement approaches remain subject to empirical validation and refinement
